SRE Architect

IBM CIO Hybrid Cloud Platform

Why Webb? The functional requirements.

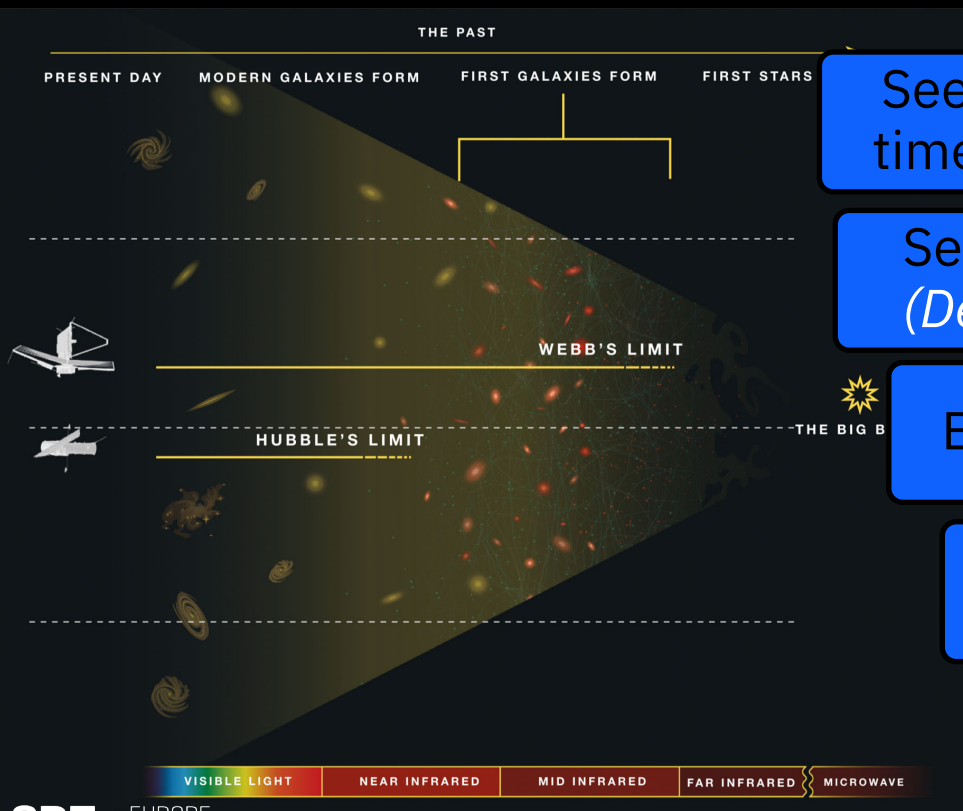

SRE CON EUROPE
MIDDLE EAST
AFRICA

@flyingbarron

Functional requirements drive non-functional ones

See further back in time (*KPI for success*)

See in the infrared (*Dev. req.*)

Be colder (*Op. env.*)

Have precise temp. control (*Ops. controls*)

Have sunshade & remote orbit (*NFR*)

Functional requirements drive non-functional ones

More capacity
(Success KPI)

Larger mirror
(Dev Req)

Mirror too large
(Ops. Const.)

Foldable mirror
(NFR)

Stable, but unreachable orbit

History of development

1990-today
1995-2003
Kickoff (1,000,000\$)

2003-2007
High level design

for development

for 10 years of operations

Detailed design & construction

2007-2021

July 2022

December 2021

Where does the trust come from?

Redundancy

Repairability

Reliability

James Webb Space Telescope

@flyingbarron

Reliability – a single point of failure?

There are 344 single-point-of-failure items...

When we identify a single point failure, we give it very special treatment.

We have what we call a critical item control plan, and we always throw in extra inspection points.

And we've done extra offline testing on these devices.

Mike Menzel
James Webb Space Telescope
Mission systems engineer

The cost of observability

The Two Sides of the Webb Telescope

Hot side

185° Fahrenheit
(85° Celsius)

Cold side

-388° Fahrenheit
(-233° Celsius)

MIRRORS

light from the Sun

First Reliability Issues

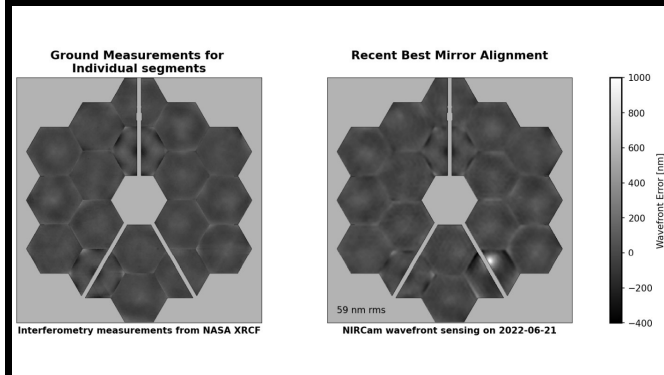

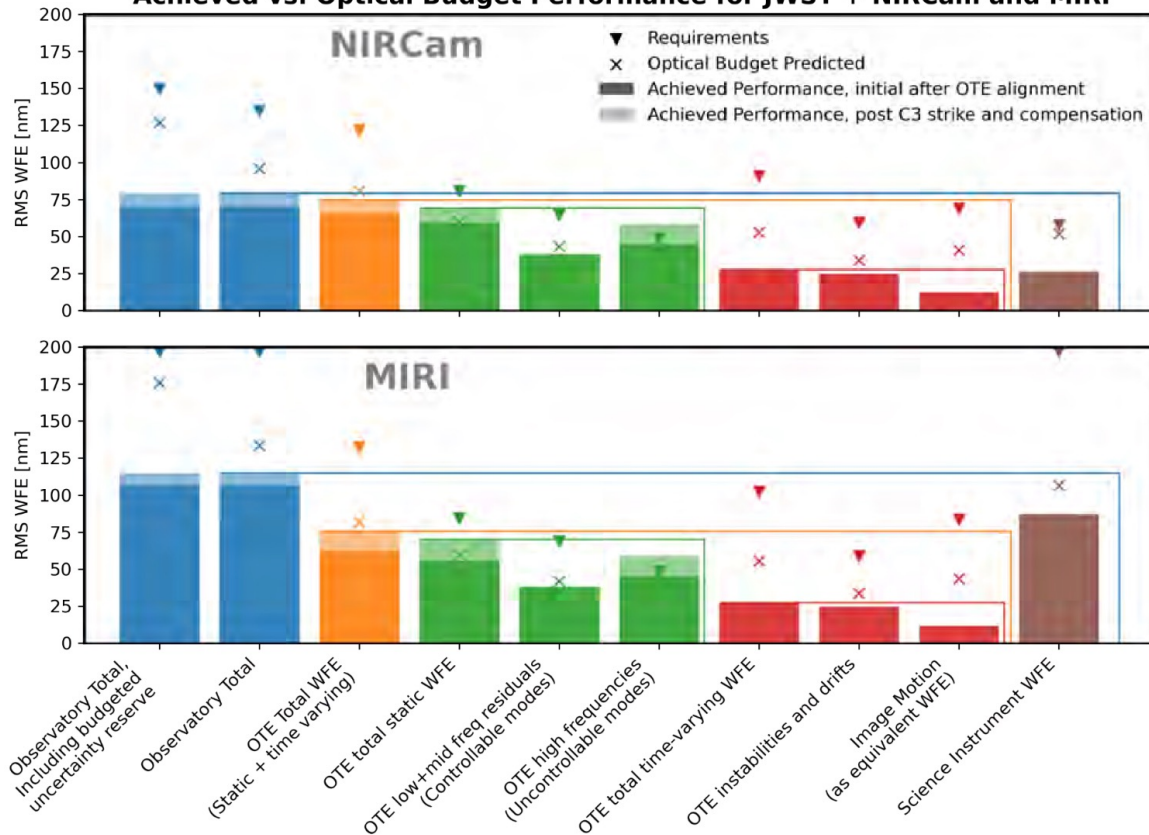

May 22-24 –
Webb hit by large meteoroid

From : Characterization of JWST science performance from commissioning
(https://www.stsci.edu/files/live/sites/www/files/home/jwst/documentation/_documents/jwst-science-performance-report.pdf)

First Reliability Issues

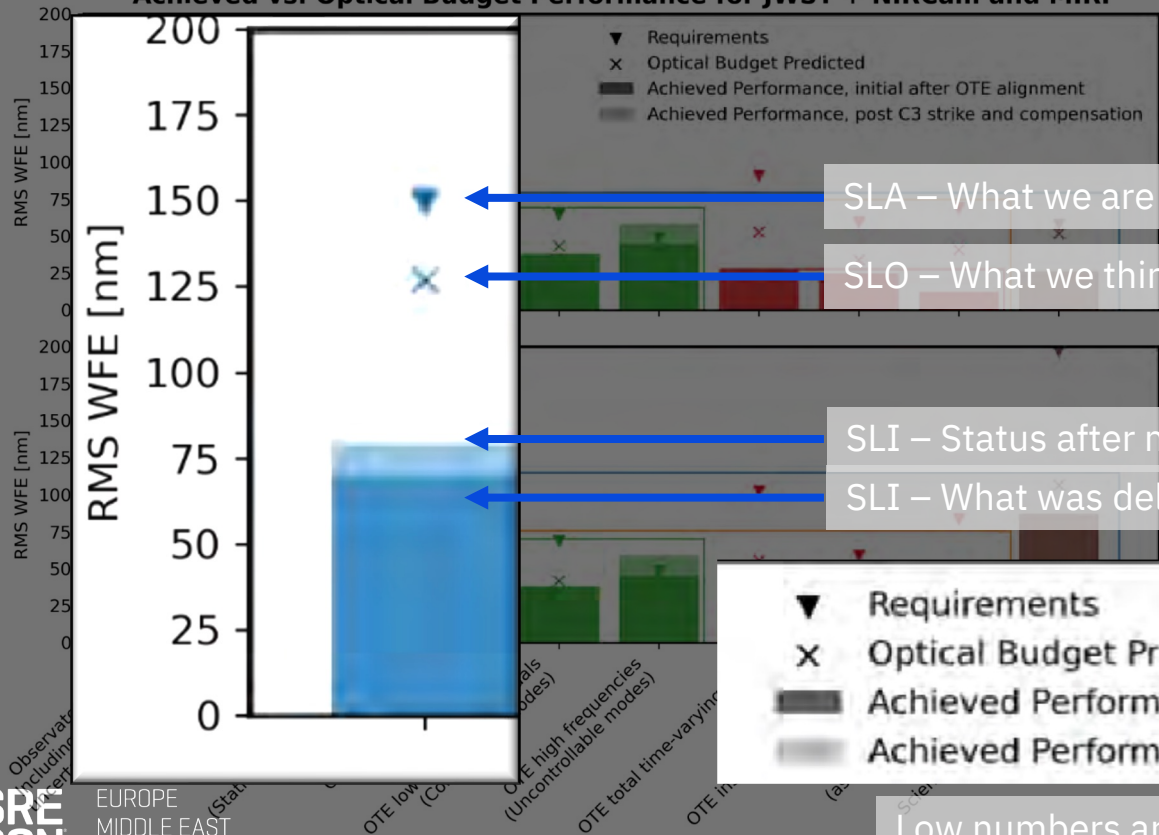

Achieved vs. Optical Budget Performance for JWST + NIRCam and MIRI

May 22-24 –
Webb hit by meteoroid

First Reliability Issues – within SLO

Achieved vs. Optical Budget Performance for JWST + NIRCam and MIRI

SLA – What we are required to deliver

SLO – What we think we can deliver

SLI – Status after micrometeoroid impact

SLI – What was delivered

- ▼ Requirements
- × Optical Budget Predicted
- Achieved Performance, initial after OTE alignment
- Achieved Performance, post C3 strike and compensation

Low numbers are good

First Reliability Issues

ESA/ATG medialab

September – High friction in the Mid-Infrared
Instrument (MIRI) focus wheels

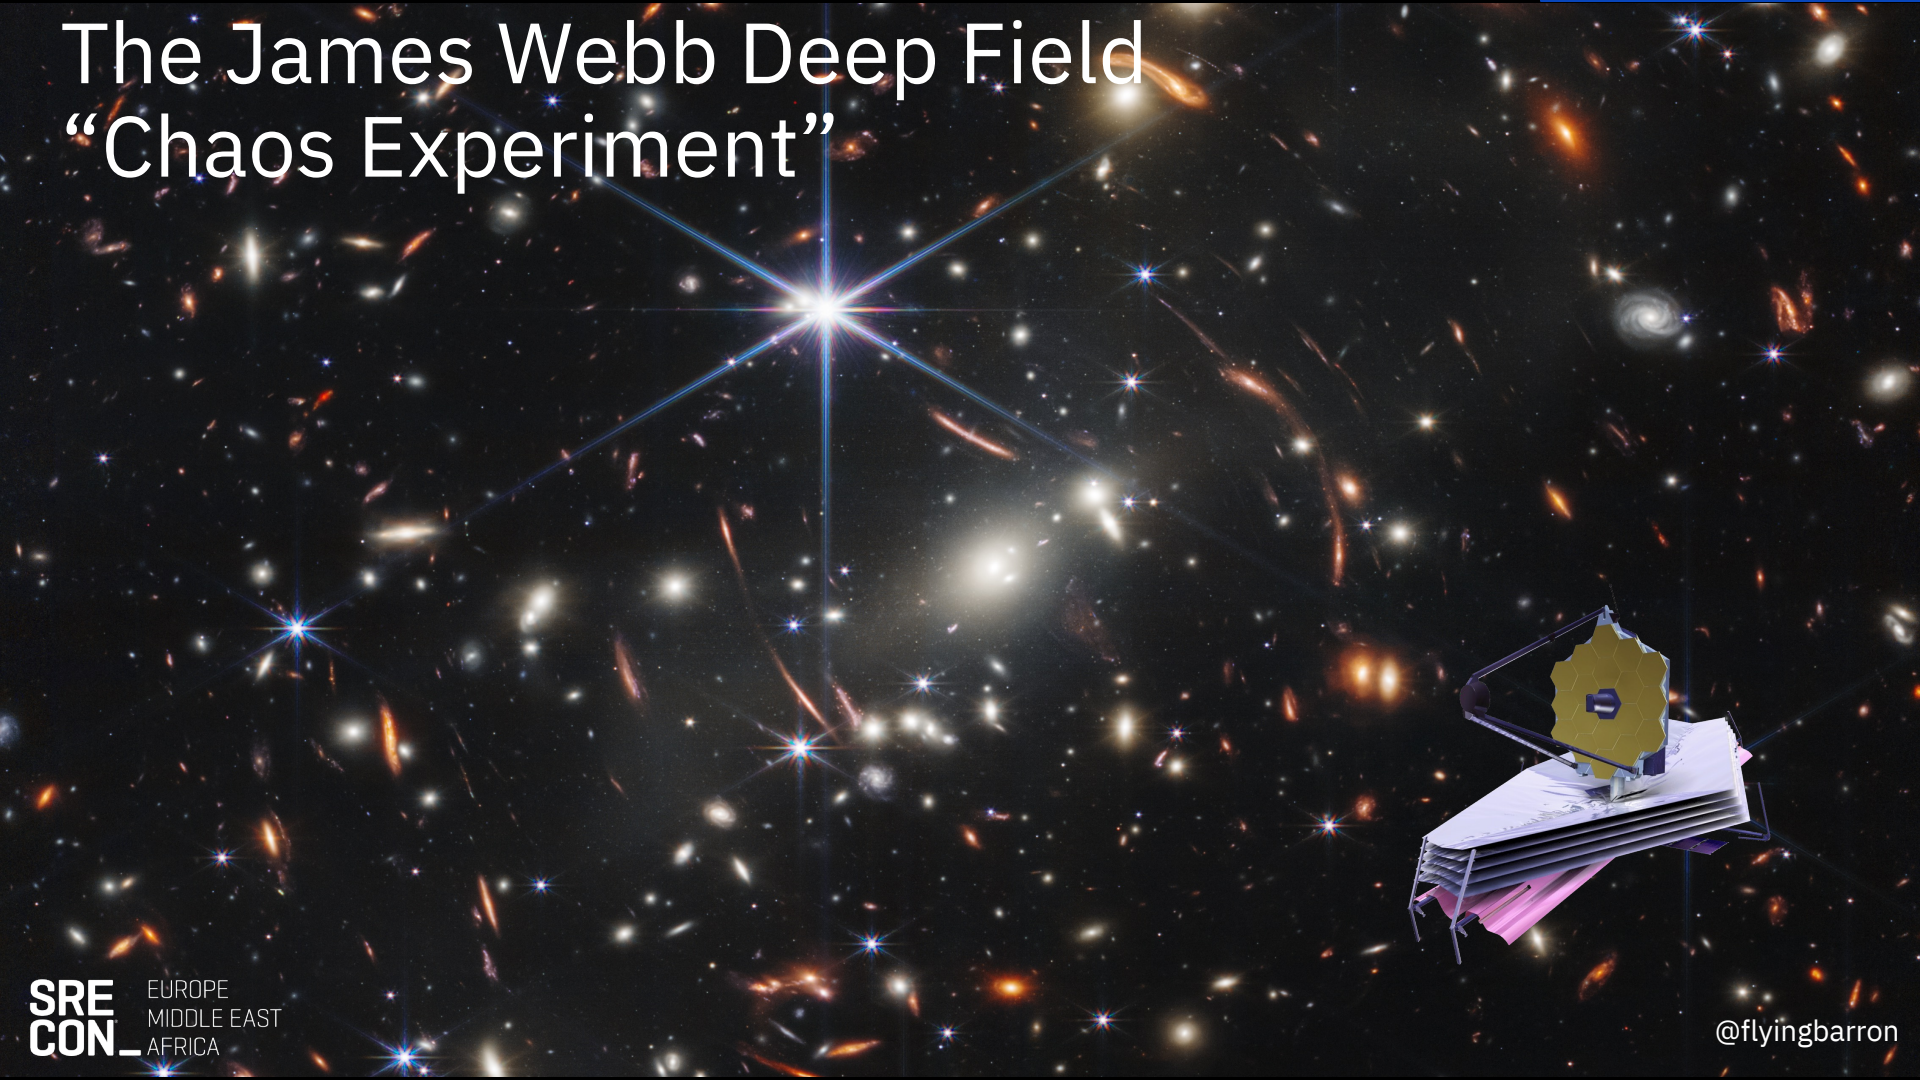

The Hubble Deep Field “Chaos Experiment”

Results:

- More galaxies than expected
- Stranger galaxies than expected
- Expand scope - James Webb Space Telescope to perform deep fields

The James Webb Deep Field “Chaos Experiment”

The Webb "SRE Strategy"

- Aim for 100% availability/success
- Embrace multiple new technologies for a new product
- Invest all efforts in one major deployment for success
- Maximize functional capability/capacity by reducing monitoring/observability load
- Achieve performance and reliability beyond SLA/SLO
- Create redundant systems, as far as possible
- Reduce technical debt / avoid problems detected in previous missions.
- Prioritize NFRs, balanced with functional requirements. Identify single points of failures
- Balance observability requirements (additional load, complexity, costs) with benefits
- Test, test, test and test some more
Tests can have business value

SREs shouldn't do it the Webb way

Do not!

- Aim for 100% availability/success
- Embrace multiple new technologies for a new product
- Invest all efforts in one major deployment for success
- Maximize functional capability/capacity by reducing monitoring/observability load
- Achieve performance and reliability beyond SLA/SLO

Do!

- Create redundant systems, as far as possible
- Reduce technical debt / avoid problems detected in previous missions.
- Prioritize NFRs, balanced with functional requirements. Identify single points of failures.
- Balance observability requirements (additional load, complexity, costs) with benefits
- Test, test, test and test some more
Tests can have business value
- Chaos Engineering as a strategy

The SRE “Webb SRE” Strategy

Redundancy

of subsystems/components/microservices/servers
Corollary: Redundancy does not replace reliability

Repairability

of systems and Replaceability of subsystems

Reliability

throughout every service

Thank you – and let's keep in touch!
